

Job Life Cycle

1

Understand
your
computations

What are the operations?
How are they
implemented/executed?

4

Monitor/
inspect
running job

Are all resources being used? All of the time? If not, why not? Can we increase resource utilization? Can we reduce resources?

2

Specify
computing
resources

Compute nodes: number and type:
num CPUs;
num GPUs;
amount of memory; type of storage.

4

Monitor/
inspect
running job

You should be using Grafana dashboard and commands to inspect EACH job at least THREE times a day.

3

Compose and
submit Slurm
sbatch script

Tell cluster the resources you
need, and for how long;
computing environment; code
invocation.

5

Inspect end-
of-job
resources

Can look at CPU and memory
utilization over the entire job. Not
so much GPUs.
